Chemdraw Software

Chemdraw is a type of software for chemistry which is used to draw the structure of chemical compounds. This chemdraw software is available to the teachers and students in the department. This software is easy to use and reduces the time to draw the structure and easily identify it. Some of the common uses of chemdraw are given below

- 1) Chemdraw is used in laboratories to draw the structure of chemical compound
- 2) It is useful to understand the stereochemistry
- 3) It is used to generate spectra
- 4) It is also used to predict the properties of the compounds
- 5) Chemdraw is used to give the IUPAC names
- 6) It is very useful to draw the structure of complex compounds, organometallics, Polymer
